Post lab (open ended):-

Output:-

Aim: To design and develop an interactive web-based simulator for the Shortest Job First (Preemptive) CPU scheduling algorithm, in order to visualize process execution, calculate scheduling parameters such as waiting time and turnaround time, and understand the working of CPU scheduling in operating systems

Conclusion
Analysis & Conclusion
Advantages
Produces the optimal (minimum) average waiting time.
Excellent for systems where throughput is a priority.
Shorter jobs are executed quickly, freeing up memory.
Limitations
Starvation: Long processes may wait indefinitely if short ones keep arriving.
Requires precise prediction of burst times (difficult in reality).
High context switching overhead due to frequent preemptions.
